1 2 simple aint stupid 4 fpr sarah +
93 minutes, so a base can be computed fresh for the local task and the
94 local authors.
95 Hence our third problem shrinks, since months of manual reading
96 becomes a background job that runs per project, not once per field.
97 Further, \textbf{it is now possible to reverse engineer, from a
98 researcher's own papers, what their particular strengths are and how
99 those strengths might attack current problems in the field}.
100 To our knowledge, that inversion was impractical before LLMs.
101
102 Further, several services (defined in this paper) augment these two ideas:
103 \begin{itemize}
104 \item a catalog of anti-patterns seen in LLM-generated text, with
105 rules for avoiding them; \item a map of the common structures of
106 research papers; \item automatically generated critiques which, acting
107 as ``conference reviewer2'', report the weaknesses of the current draft and
108 propose a revision that avoids at least some of them; \item etc.
109 \end{itemize}
110 \subsection{Frequently Asked Questions}
111 Before starting, two frequently asked questions deserve answers.
112 Fistly, {\em Should we follow Newell's advice at all?}
113 Is it wise to focus on your personnel strengths?
114 When all you know is hammers, then all you can see are nails.
115 If everyone focuses on just their own tricks, then we run the risk
116 needless
117 experimentation of inappropriate chocies,
118 On the other hand,
119 even if our personnel strengths choose the tools,
120 a field's
121 open problems choose the targets.
122 Hence the hammer is aimed, not
123 wandering.
124 In our experience the method does not drive a career into a rut, for
125 two reasons.
126 Firstly, the
127 literature review step (described below) forcing contact with material outside prior
128 experience, and the resulting experiments force a critical evaluation and maturation
129 of the

GitHub and Overleaf. Section 5's SE-venue literature survey now includes your three team papers as seeds. Next: your review of the pause-box questions, or draft section 6.

» "s" has to explained as well in the caption as well

Pushed to main, ran 2 shell commands

- Pushed 5c6b6c2. Table caption now reads: "...Rows marked 's' are seeds: the team's own in-query papers, admitted regardless of the knee." (First attempt no-opped – fmt had rewrapped the caption since my last read; matched the real text and it landed.) Compiles clean, both remotes current.

* Brewed for 1m 33s

» the text in "paper..." could be wider

Pushed to main

- Pushed f0d8a8f. Paper column widened (0.5→0.56 of line width), titles now truncate at 78 chars instead of 48 (most fit whole), venues at 26. Full titles like "On the use of deep learning in software defect prediction" now display uncut. Compiles clean.

* Crunched for 56s

※ recap: Building paper0 (Follow Your Strengths, LLM-assisted paper writing) in how2rite, synced to GitHub and Overleaf. Just finished section 5's SE-venue lit review with seeded reading-set table. Next: your review of the pause boxes, or draft section 6.

» explain the expression "hammer looking for a nail". succinctly, preogessionally

- The expression names the law of the instrument: a person skilled with one tool tends to redefine every problem as the kind that tool solves – method chosen first, problem recast to fit. Provenance, if you want a citation: Kaplan (1964), "Give a small boy a hammer, and he will find that everything he encounters needs pounding"; Maslow (1966), "It is tempting, if the only tool you have is a hammer, to treat everything as if it were a nail."

For the FAQ's context, one professional sentence: "The risk, known as the law of the instrument, is that mastery of a method quietly redefines every problem as one that method solves."

Want it as a footnote on the hammer sentence in the intro FAQ, with the Kaplan/Maslow attributions (I'd add kaplan64/maslow66 bib entries, verified)?

* Worked for 51s

» can i get a tabe linked to setion2 offer deteils directions on how my aoc-uthors can get gitbirdge going for this repo

Pushed to main, ran 1 shell command

- Pushed c01088e. §2 now ends with Table (tab:bridge), full-width, three rows:

- Rung 2 (Overleaf browser): accept invite → set Main document → daily: edit sec0/, newline after every full stop, \note{you}{...}, Cmd-Enter.
- Rung 3 (GitHub): clone → daily: pull, edit, make fmt, commit, push.
- Rung 4 (git bridge): rung 3 + generate Overleaf token (Account Settings → Git Integration; username git, password = token) + git remote add overleaf
https://git.overleaf.com/6a665a138dbd6c9b6ef7d809 → daily: git pull overleaf main, edit, build, push to both remotes.

Caption states who to ask for invites/access (first author). Rungs 0-1 need no setup so they're not in the table. fmt.py won't mangle it – tabular is in its protected list. Compiles clean, live on both remotes.
